In simple terms the lower the number the brighter the object. This type of refractor produced much sharper images because most of the visual wavelengths were brought to a relatively common focus. Light is reflected from the primary to the secondary and then back out of the bottom of the tube through a hole in the primary.

You need a lot of aperture and focal length if you want to shoot small planetary. The number of shots taken depends on the time you. Do you want to do high-resolution work, or wide-field astrophotography? I contacted Faulkes Telescope control, who put me in touch with the BAA comet section director, who kindly logged this observation the same day.

In most cases the data will be obtained automatically, in several observations. Does the above image look like if we open it in a typical DSLR RAW conversion program, and then do, say, 15 seconds worth of work on it?
